

THE IMPACT OF COVID-19 ON THE 2020 ROUND OF CENSUSES

Dr. Vu Thi Thu THUY, Director
Department of Data Collection and IT Application,
The Vietnam General Statistics Office

The 2020 round of population censuses

“

The 2020 round of population censuses conducted in the circumstance of Covid-19 Pandemic outbreak in late December 2019 that has affected to many countries

The 2020 round of population censuses have been affected negatively by Covid-19 Pandemic

- Contacting to respondents
- Defining right respondent to be counted
- Counting population
- Quality of information
- Limited resources
- Technological application

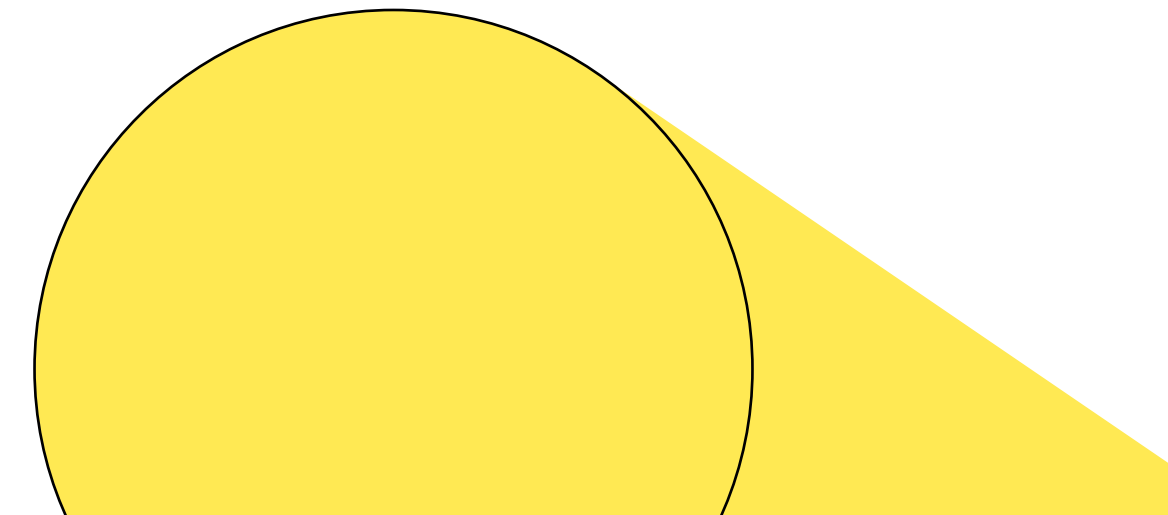

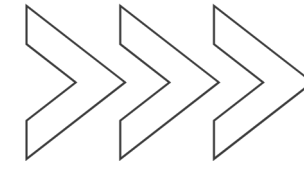

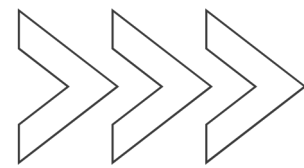

Contacting to respondents

Methodology of population census data collection is face to face interview

During Covid-19 Pandemic, local authorities impose travel restrictions

It's difficult to contact households and respondents to collect information

The 2020 round of population censuses

Population censuses typically use one of two approaches:

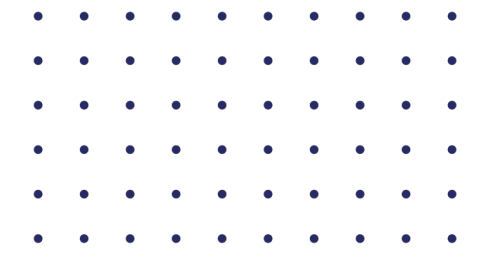

- De facto
- De jure

It's difficult to define right respondents to be counted in the context of pandemic

Defining De jure population in one area is more difficult and less accuracy during Covid-19 pandemic than normal circumstance

The data collected by population censuses during Covid-19 Pandemic does not fully reflect the number of people in the normal reality of a country (in a typical year)

There is hardly enough evidence to build programs and make policies for development in forthcoming years

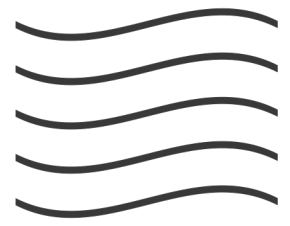

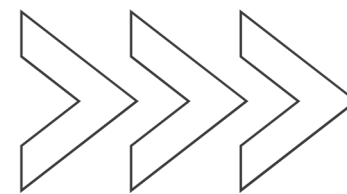

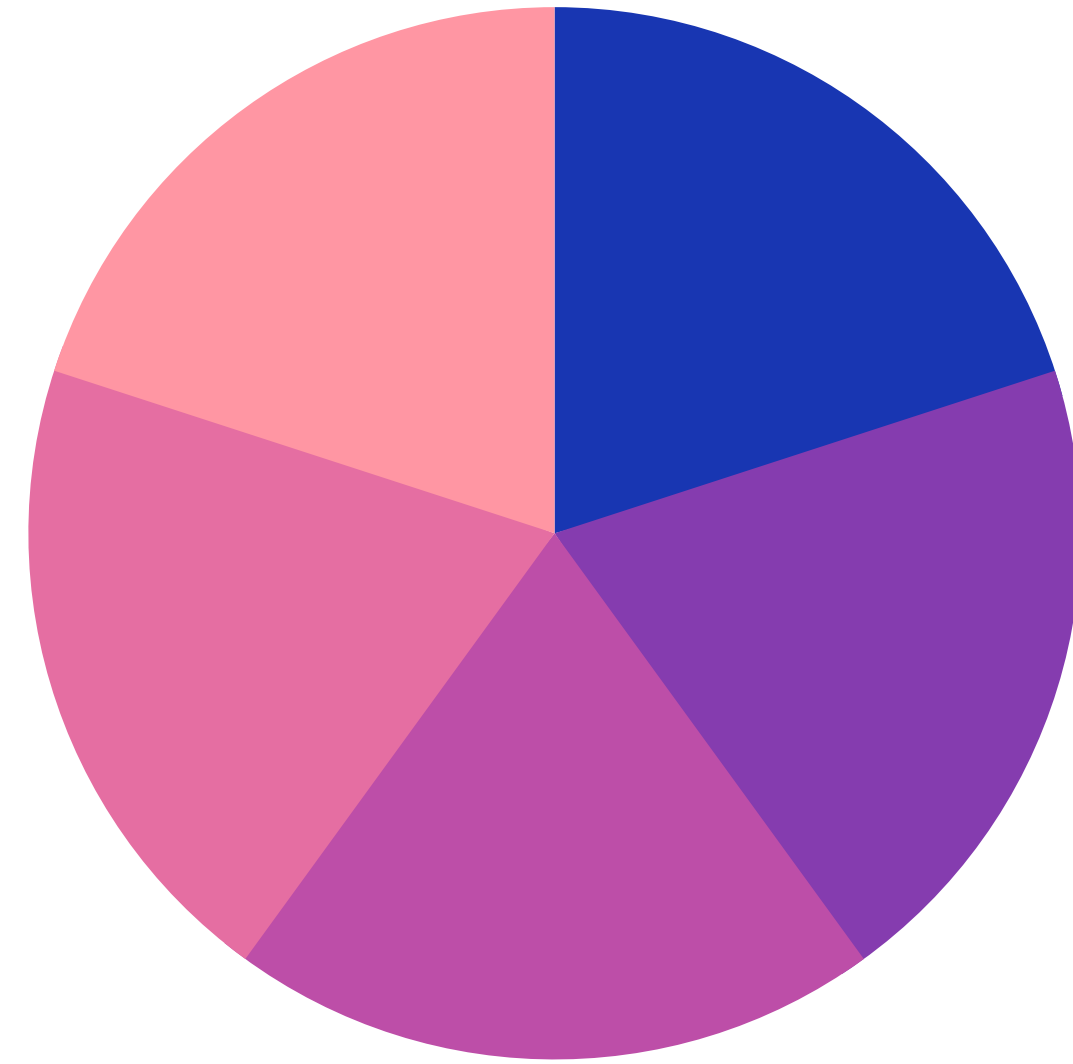

Covid-19 pandemic effects to quality of data collected from population census

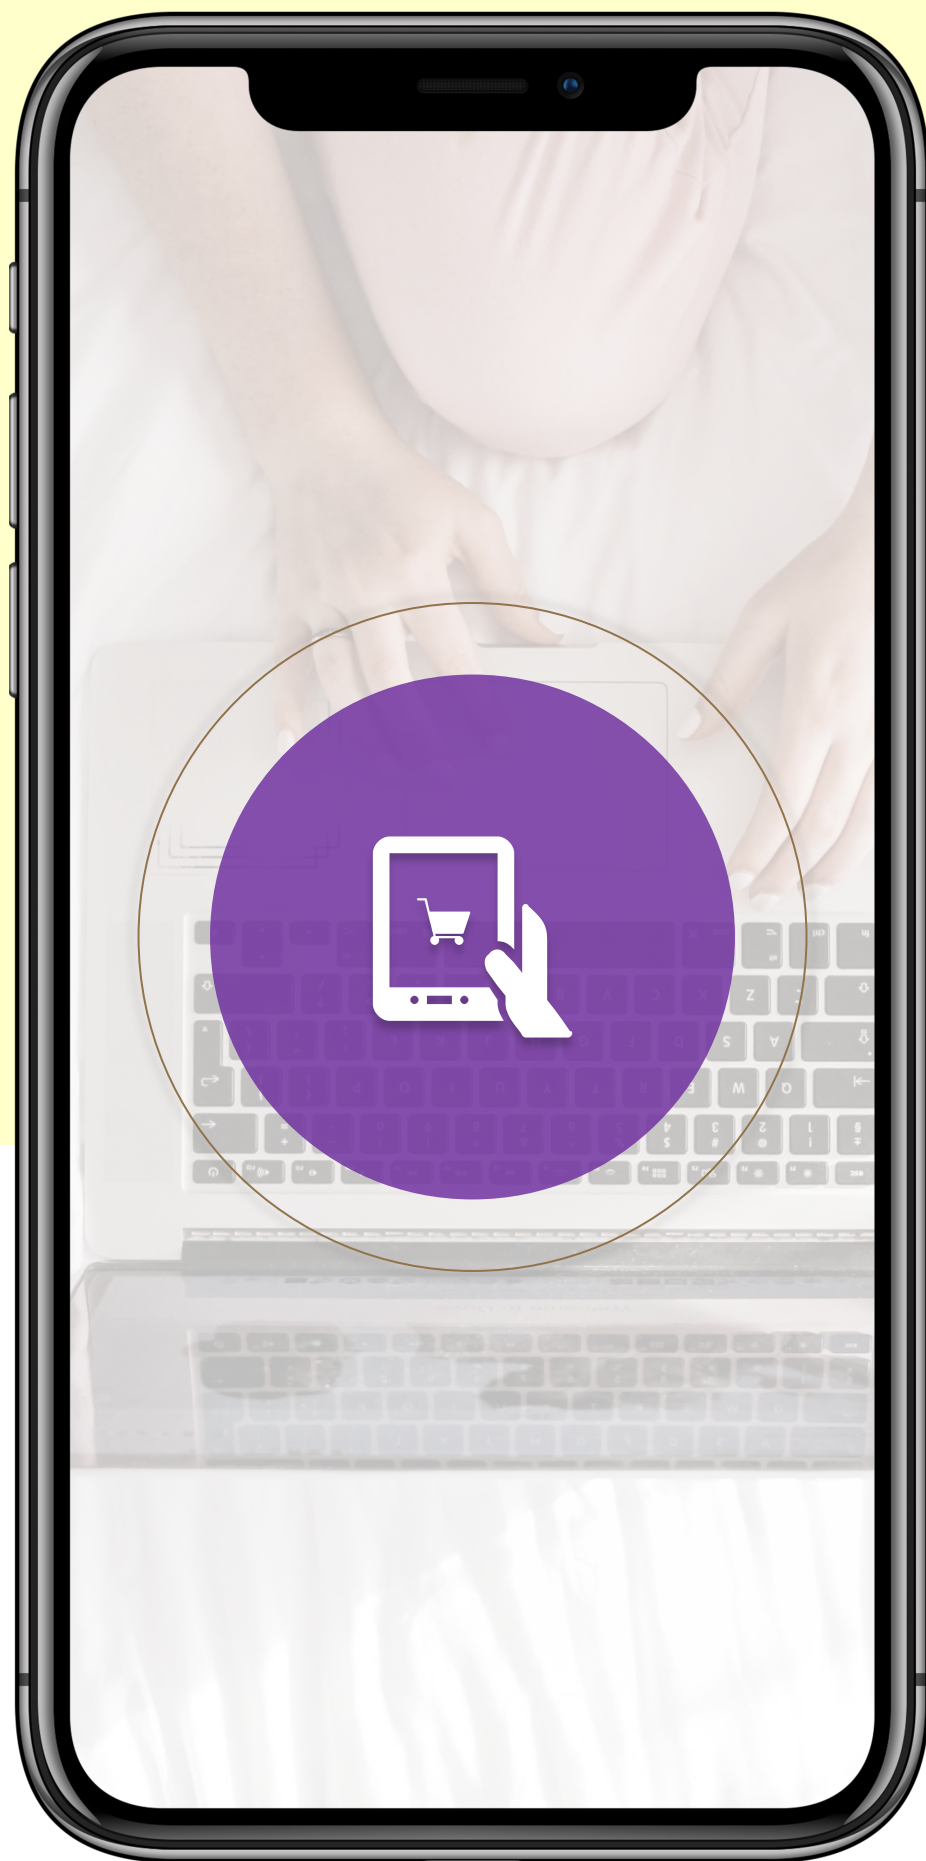

In the context of the Covid-19 outbreak, respondents and interviewers tend to involve in data collection process less actively

During the Covid-19 Pandemic, national resources prioritize on disease prevention and control (especially financial resource)

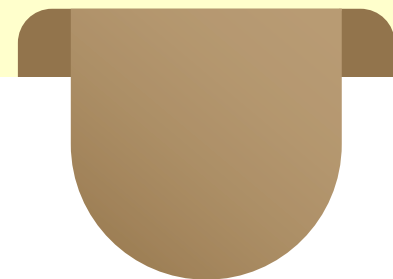

Therefore, the 2020 census is limited by budget and human resources

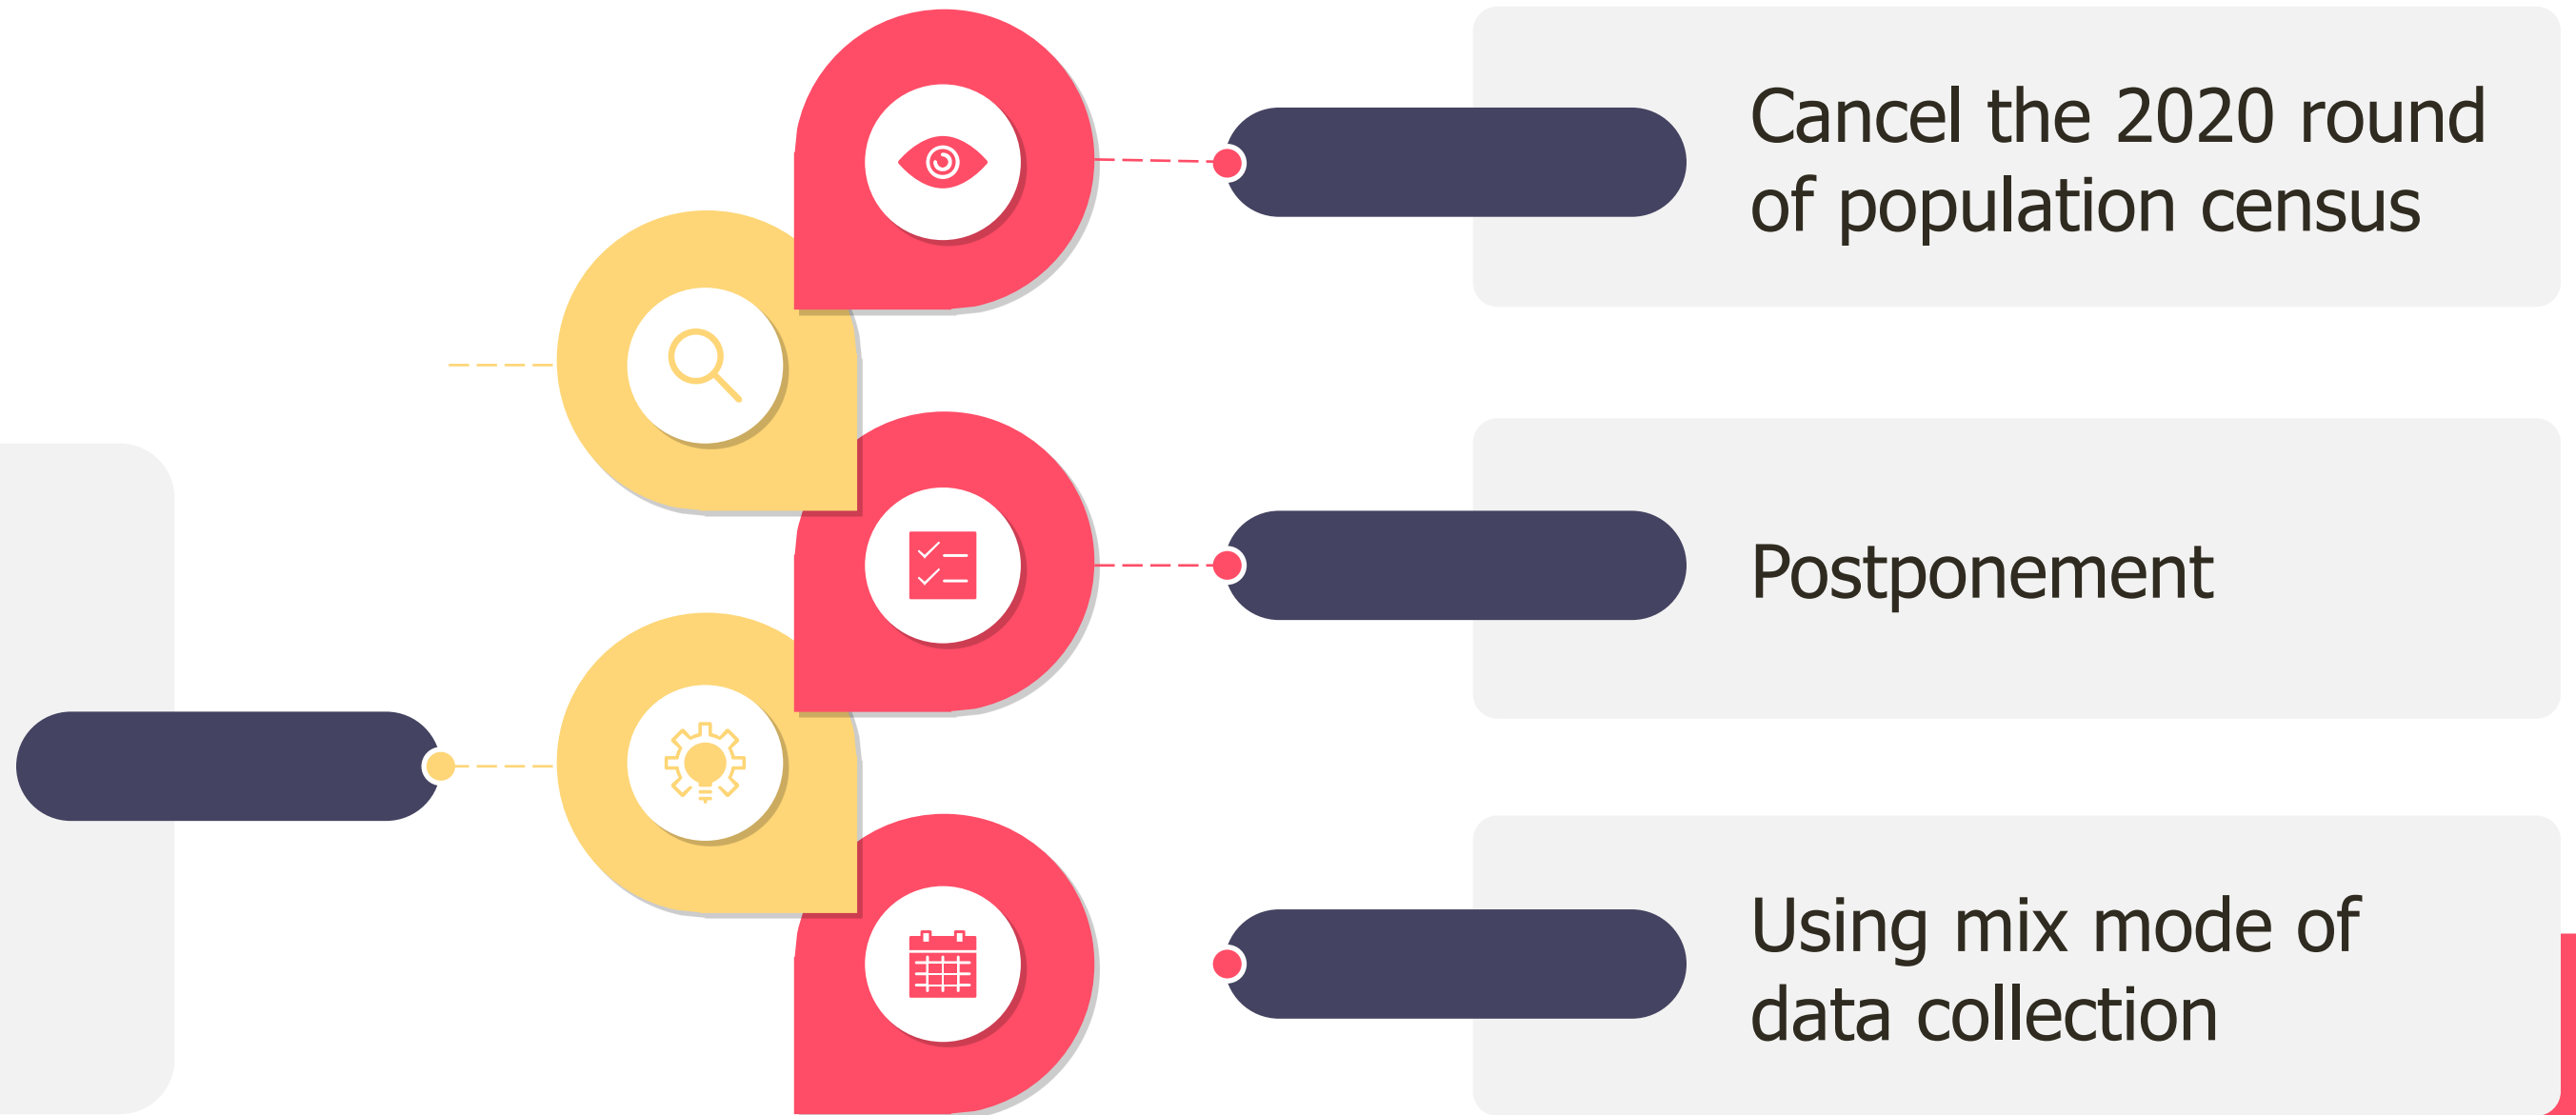

Technological application

The 2020 round of population censuses implemented in the context of survey mode innovation and information technology application

Resources for innovation are limited due to Covid-19 Pandemic that affects the progress and quality of the census

To overcome the challenges, countries have been adapting to the pandemic

How is about your country?

1

How is the response to the Covid-19 Pandemic on implementing the 2020 population census?

2

Does your NSO cooperate/supports or sharing experiences with other countries on coping with Covid-19 Pandemic? What type of cooperate/support/sharing experience?

3

Do you (NSO/organizations) have any recommendations for future population census when unexpected incidents occur that affect the implementation and data quality of population census?
